

ABSTRACT OF THE INVENTION

A securing device for walls set in grooves of cabinet furniture including at least one first support element that can be placed in an angle area between the rear wall and a grooved sidewall and at least one second support element that can be placed in the angle area between the rear wall and a grooved shelf and/or top board. The at least one support elements has contact sides that are each at a right angle to one another and diagonal to the contact sides, and a through hole for receiving a screw, setscrew, a set pin, or other fastener. For purposes of easier handling and more reliable securing of the cabinet furniture elements, which are to be connected to one another in the corner area at an angle of 90 degrees, the at least first and second support elements are integrated in one piece into the legs of a corner angle piece. At least one of the first or second support elements is formed at each of the legs of the corner angle piece.
